# Dynamic Programming

## Forward Approach

$$\text{Cost}(i, j) = \text{Min} \left[ c(j, x) + \text{Cost}(i+1, x) \right]$$

Annotations:   
 -  $i$ : stage   
 -  $j$ : vertex   
 -  $x$ : vertex   
 -  $i+1$ : stage   
 -  $x$ : vertex in next stage

\* Destination to Source to solve  $d[j] = \infty$

\* To find shortest distance source to destination

## Backward Approach

$$\text{Cost}(i, j) = \text{Min} \left\{ c(x, j) + \text{Cost}(i-1, x) \right\}$$

Annotations:   
 -  $i$ : stage   
 -  $j$ : vertex   
 -  $x$ : vertex   
 -  $i-1$ : stage   
 -  $x$ : vertex in previous stage

$d[j] = \infty$

\* Source to Destination

\* To find shortest distance destination to Source

## 0/1 Knapsack

### Tabular Method

$$T[i, j] = \text{Max} \left\{ T[i-1, j], P_i + T[i-1, j-w_i] \right\}$$

if  $w_i > j$

$$\text{if } (T[i, k] \neq T[i-1, k])$$

$$i = i-1 \quad \& \quad k = k - w_i$$

Else

$$i = i-1$$

## OBST

$$W(i, j) = \sum_{k=i+1}^j p_k + \sum_{k=i}^j q_k \quad i < j$$

$$j-i = 0, 1, 2, 3, 4, \dots$$

$$W(i, j) = p_j + q_i + W(i, j-1)$$

$$C(i, j) = \min_{i < k \leq j} \{ C(i, k-1) + C(k, j) \} + W_{ij}$$

$$r(i, j) = k$$

## TRAVELLING SALESPERSON PROBLEM

$$g(i, S) = \min_{j \in S} [C(i, j) + g(j, S - \{j\})]$$

$$P[i, S] = S$$

## All pairs Shortest Path Problem (Floyd Warshall Algo)

$$A^k(i, j) = A^{k-1}(i, k) + A^{k-1}(k, j), \quad A^{k-1}(i, j)$$

Single Source Shortest path Using DP  
(Bellman) Ford Algorithm

$$\text{dist}^k[u] = \min \{ \text{dist}^{k-1}[u], \min \{ \text{dist}^{k-1}[i] + \text{cost}[i, u] \} \}$$

## Dynamic

\* Forward / backward

$$\begin{aligned} TC &= O(|V| + |E|) + |K| \\ &= \quad \quad \quad \uparrow \text{ stages of relaxation} \quad \quad \quad \leftarrow \text{find minimum cost path} \\ &= \underline{O(|V| + |E|)} \end{aligned}$$

\* 0/1 knapsack

Set Method & Tabular Method

$$\underline{TC = O(nm)}$$

$m \rightarrow$  capacity of knapsack

\* ISP

$$\underline{TC = N \times 2^N}$$

\* All pair shortest path (Floyd)

$$TC = O(n^3)$$

\* Single Source (Bellman ford)

$$TC = (|E| \times n-1) \Rightarrow O((n-1) \times (n-1)) = O(n^2)$$

## REID V

### \* Fractional Knapsack

#### Time Complexity

a) minimum time to sort the array :  $O(n \log n)$

b) Time required to choose the feasible set :  $\sum_1^n 1 = n = O(n)$

$$TC = \underline{O(n \log n)} + \underline{O(n)} = \underline{O(n \log n)}$$

### \* Kruskal

Construction of heap  $O(|E|)$

Sorting the edge based on weights :

$$\underline{TC = O(|E| \log |E|)} \quad E \rightarrow \text{Edge set of } G$$

### \* PRIM

$$\underline{TC = O(n^2)} \text{ OR } O(V^2) \text{ where } n = V = \text{vertices}$$

TC can be reduced using Binary heap

### \* Dijkstra's Algorithm

$$\underline{O((n + |E|) \log n)}$$
